Professional Summary

Software Engineer specializing in AI-powered enterprise platforms, developer productivity, infrastructure automation, and intelligent workflow orchestration. Experienced in designing scalable full-stack applications using Python, FastAPI, Next.js, React, Azure AI, OpenTofu/Terraform, LLMs, RAG, and multi-agent architectures. Strong background in enterprise platform engineering, AI-assisted software development, RBAC, system design, and developer experience.

Technical Skills

Languages: Java, Python, TypeScript, JavaScript, Go

Frontend: React.js, Next.js, Tailwind CSS

Backend: FastAPI, Spring Boot, REST APIs, WebSockets, Microservices

AI: Azure AI Foundry, Azure OpenAI, LangChain, LangGraph, RAG, MCP, AI SDK, Claude Code, GitHub Copilot, Prompt Engineering, AI Agents

Infrastructure: OpenTofu, Terraform, GitHub Actions

Database: PostgreSQL, MySQL, NeonDB

Architecture: RBAC, Authentication, Authorization, Caching, Multi-Tenant Systems, System Design

Professional Experience

Synergech Technologies, Chennai

Software Engineer

May 2025 – Present

Product: InfraGenie Suite — Enterprise Cloud Governance & Automation Platform

Stack: Next.js, PostgreSQL, FastAPI, AI-SDK, Claude Code, OpenTofu/Terraform, Azure, ServiceNow

InfraGenie (Internal Enterprise Platform)

- **Situation:** Repository provisioning, access approvals, and cloud cost oversight were handled manually across the organization, slowing DevOps delivery and creating governance gaps across Prod/Dev/QA environments.
- **Task:** Design a single platform unifying provisioning, access governance, ticketing, and cost control for four distinct roles — platform team, end users, management, and DevOps engineers.
- **Action:** Built an in-house RBAC & ABAC engine, an access-package request and ticketing system, OpenTofu/Terraform-based provisioning pipelines, ServiceNow integration, environment-scoped workspaces, and cost-management dashboards enforcing per-resource-group budget thresholds, using FastAPI, Next.js, and PostgreSQL.
- **Reward:** Cut organizational cloud spend by ~50%, reduced access-provisioning turnaround time by ~80%, and automated CI/CD pipeline governance for all onboarded teams.

InfraZero (Public Beta Platform)

- **Situation:** No public-facing, lightweight equivalent of InfraGenie existed for external users who needed simplified infrastructure provisioning without full enterprise overhead.
- **Task:** Ship a public beta carrying forward core InfraGenie capabilities — chat-driven project workflows and RBAC/ABAC — through a phased, version-by-version rollout.
- **Action:** Re-architected the provisioning workflow and access-control layer into a leaner public product, iterating feature parity release by release.
- **Reward:** Delivered a functioning public beta with a clear version-wise feature-parity roadmap, extending platform reach beyond internal enterprise users.

Infra Landing Platform

- **Situation:** InfraZero had no external-facing channel to communicate its features, pricing, or workflows to prospective users.
- **Task:** Build a marketing landing site that converts visitors into signups by clearly showcasing product value.
- **Action:** Designed and developed a responsive landing website covering feature highlights, pricing tiers, and workflow walkthroughs; produced supporting LinkedIn marketing content and a recorded product demo video for go-to-market.

- **Reward:** Established the primary acquisition and marketing entry point for the public product launch.

Infra Documentation Platform

- **Situation:** Public users lacked a self-service resource to learn or troubleshoot the platform, increasing support dependency.
- **Task:** Deliver a documentation portal supporting search, multilingual access, and AI-assisted content help.
- **Action:** Built a documentation portal with Markdown rendering, full-text search, multilingual support, and AI-assisted documentation generation.
- **Reward:** Improved user self-service and onboarding, reducing inbound support load for the public product.

Product: Agent Orchestration & Analytics Platform (Agents Marketplace)

Stack: Next.js, Python, PostgreSQL, VS Code Extension API, Claude Code, Azure AI Foundry

Claude Code Analytics & Marketplace Platform

- **Situation:** Leadership had no visibility into Claude Code, GitHub Copilot, and Codex seat usage or developer productivity, and teams had no centralized way to reuse AI skills/agents across the organization.
- **Task:** Build an analytics and governance layer giving management usage insight while enabling org-wide, version-controlled agent/skill reuse.
- **Action:** Built a usage-upload and insights engine, a Skills & Agents Marketplace with fork mechanism and version control, seat-allocation management, live and historical dashboards, org-wide RBAC, and Azure AI Foundry agent-registry integration.
- **Reward:** Gave leadership real-time visibility into AI-tool adoption and developer productivity, enabling data-driven seat reallocation across **100%** of onboarded teams.

Workflow Orchestration (Business Users)

- **Situation:** Business teams had no no-code way to chain Azure AI Foundry agents into repeatable, multi-step workflows.
- **Task:** Build an orchestration engine letting non-developers create, pull from marketplace, and run agent-based workflows.
- **Action:** Implemented a no-code workflow builder, execution engine, monitoring, and orchestration pipelines connecting marketplace and Foundry agents; work is now extending into agent evaluation and governance.
- **Reward:** Enabled business users to automate multi-step tasks end-to-end without engineering support.

VS Code Extension (Developer SDLC)

- **Situation:** Developers lacked an equivalent agent-orchestration capability embedded in their IDE for build–develop–deploy workflows.
- **Task:** Deliver a VS Code extension enabling in-IDE creation and execution of AI-driven SDLC workflows.
- **Action:** Built an extension supporting agent install/pull, configurable workflow-driven code generation, and orchestrator-triggered automation across the SDLC.
- **Reward:** Reduced developer context-switching and standardized AI-assisted automation directly inside the IDE.

Autonomous Testing Platform

- **Situation:** QA work was split across manual task tracking and separate API-testing tools, with no collaborative, AI-assisted testing workspace.
- **Task:** Build a unified workspace combining project/task management with autonomous, AI-driven test execution.
- **Action:** Developed collaborative Kanban-based workspaces and integrated Playwright MCP, Postman MCP, and AI chat agents for autonomous UI/API test authoring and execution.
- **Reward:** Consolidated test planning and execution into a single AI-assisted workspace, cutting manual test-authoring effort.

Project: RiskGuard AI (Client Project) — AI-Assisted Underwriting Platform

Stack: Python (FastAPI), React.js, PostgreSQL, Azure AI Foundry, Azure AI Search, Azure Content Understanding, Claude Code, GitHub Copilot

Document-Driven Underwriting Automation

- **Situation:** Underwriters manually reviewed applicant documents and researched risk context before approving or denying insurance claims, taking anywhere from half a day to over two days per case.
- **Task:** Build a human-in-the-loop (HITL) system that automates document verification, contextual research, and decision support while keeping underwriters in control of the final call.
- **Action:** Built a document-processing pipeline on Azure AI Search and Azure Content Understanding, integrated automated web research for supporting insights, and developed a React-based workspace with multi-document project versioning for underwriters.
- **Reward:** Reduced typical review time from up to **2 days** to as little as **~15 minutes**, with edge cases capped at ~1 hour — a time reduction of roughly **90–98%**.

Software Engineer Intern

Feb 2025 – Apr 2025

- Built AI-assisted document processing, workflow automation, and backend integrations.
- Worked on enterprise proof-of-concepts involving AI, APIs, and scalable applications.

Graduate Engineer Trainee

Aug 2024 – Jan 2025

- Developed Spring Boot and React applications with REST APIs.
- Strengthened backend, database, and system architecture fundamentals.

AI-Assisted Software Engineering

- Advanced user of Claude Code and GitHub Copilot for enterprise software development.
- Experienced with Agent Mode, Edit Mode, Planning Mode, approval workflows, and AI-driven development practices.
- Integrated reusable Claude Skills and AI Agents into engineering workflows.
- Built AI-assisted workflows for development, documentation, testing, Git operations, commits, and pull requests.
- Selected appropriate AI models based on reasoning complexity, speed, and context requirements.
- Experienced with MCP integrations, AI SDKs, RAG pipelines, and enterprise agent workflows.

Leadership & Technical Contributions

- Led Next.js architecture migration and established reusable project structure.
- Conducted internal knowledge sharing on Next.js, AI SDKs and AI development practices.
- Participated in client demos, solution presentations and architecture discussions.
- Contributed to coding standards, reusable architecture and developer productivity initiatives.

Personal Projects

useApiGuard — *Next.js, TypeScript, React*

- Designed and published a reusable React hook to standardize API communication across applications.
- Simplified API handling by centralizing loading states, error handling, request lifecycle management, and response processing.
- Open-sourced the package with comprehensive documentation and real-world implementation examples.
- Published as an NPM package for reuse across multiple React and Next.js projects.

Hospify – Hospital Management System — *Spring Boot, React.js, MySQL*

- Developed a comprehensive hospital management platform supporting patients, doctors, hospitals, and administrative workflows.
- Built modules for patient registration, doctor management, appointment scheduling, and hospital administration.
- Implemented seamless appointment booking with doctor availability management and scheduling workflows.
- Designed medicine management and prescription tracking modules to streamline healthcare operations.
- Developed RESTful APIs using Spring Boot and integrated them with a responsive React.js frontend.
- Designed relational database schemas and managed source control using Git and GitHub.

Task Manager — *Next.js, TypeScript, PostgreSQL*

- Bootstrapped and architected a personal productivity platform using Next.js for managing learning, projects, certifications, career goals, and daily tasks.
- Designed interactive dashboards with progress tracking, activity timelines, Kanban boards, and productivity

analytics.

- Built modules for project management, team collaboration, certification tracking, roadmap planning, and career progression.
- Planned as an open-source productivity platform with self-hosting support, allowing individuals and teams to manage tasks and workflows free of cost.
- Focused on scalable architecture, reusable components, and extensible design for future community contributions.

Achievements

- Emerging Star Award – Synergech (2025)

Certifications & Courses

- Claude Code in Action – Anthropic
- Building with the Claude API – Anthropic
- Introduction to Model Context Protocol – Anthropic
- Model Context Protocol: Advanced Topics – Anthropic
- Introduction to Agent Skills
- Microsoft Certified: Azure AI Engineer Associate (AI-102) – Preparing
