## Professional Summary

Software Engineer specializing in AI-powered enterprise platforms, developer productivity, infrastructure automation, and intelligent workflow orchestration. Experienced in designing scalable full-stack applications using Python, FastAPI, Next.js, React, Azure AI, OpenTofu/Terraform, LLMs, RAG, and multi-agent architectures, with a strong background in enterprise platform engineering, AI-assisted software development, and system design.

## Technical Skills

**Languages:** Java, Python, TypeScript, JavaScript, Go

**Frontend:** React.js, Next.js, Tailwind CSS

**Backend:** FastAPI, Spring Boot, REST APIs, WebSockets, Microservices

**AI:** Azure AI Foundry, Azure OpenAI, LangChain, LangGraph, RAG, MCP, AI SDK, Claude Code, GitHub Copilot, Prompt Engineering, AI Agents

**Infrastructure:** OpenTofu, Terraform, GitHub Actions

**Database:** PostgreSQL, MySQL, NeonDB

**Architecture:** RBAC, Authentication, Authorization, Caching, Multi-Tenant Systems, System Design

## Professional Experience

**Synergech Technologies, Chennai**

**Software Engineer**

May 2025 – Present

**Product: InfraGenie Suite — Enterprise Cloud Governance & Automation Platform**

*Stack: Next.js, PostgreSQL, FastAPI, AI-SDK, Claude Code, OpenTofu/Terraform, Azure, ServiceNow*

- Built an internal platform that automates CI/CD pipelines across every application in the organization, with a ticketing system that provisions repositories, resource groups, and Azure resources (App Service, Web Apps, and more) on request.
- Designed and built an org-wide access-package mechanism plus an in-house RBAC & ABAC engine from scratch, serving four distinct roles — platform team, end users, management, and DevOps engineers — with every project managed inside environment-scoped workspaces (Prod/Dev/QA).
- Built a cloud-wide cost-management dashboard enforcing budget-threshold policies per resource group across all onboarded projects; cut organizational cloud spend by ~**50%**, reduced access-provisioning turnaround by ~**80%**, and freed the IT team from manual access handling.
- Re-architected InfraGenie's core capabilities into **infra0**, a leaner public product carrying forward chat-based project workflows and the same RBAC/ABAC model, rolled out feature-by-feature in a phased public beta.
- Designed and built the public landing page showcasing infra0's features and a complete self-service documentation platform for public users, and produced supporting LinkedIn marketing content and a recorded product demo video for go-to-market.

**Product: AgentFlow — Agentic Workflow, Analytics & Marketplace Platform**

*Stack: Next.js, Python, PostgreSQL, VS Code Extension API, Claude Code, Azure AI Foundry*

- Built an analytics application where users upload monthly Claude usage data to get extended productivity insights, alongside an organization-wide Skills & Agents Marketplace with a fork mechanism and version control for reusable agents and skills.
- Built a business-facing workflow-orchestration engine letting users create agents or pull them from the marketplace or Azure AI Foundry, assemble them into workflows, and trigger an orchestrator that calls the relevant agents end-to-end to complete the task.
- Added seat-allocation management so leadership can assign Claude Code, Codex, and GitHub Copilot seats by usage, plus performance and comparison dashboards benchmarking AI-tool and vibe-coding usage across developers and teams.
- Built a VS Code extension bringing the same agent install/pull and orchestration model into the developer SDLC, so orchestrator-triggered agents can build, develop, and deploy code changes directly from the IDE; currently extending the platform into agent evaluation and governance.

**Project: RiskGuard AI (Client Project) — AI-Assisted Underwriting Platform**

*Stack: Python (FastAPI), React.js, PostgreSQL, Azure AI Foundry, Azure AI Search, Azure Content Understanding, Claude Code, GitHub Copilot*

- Built a document-processing pipeline on Azure AI Search and Azure Content Understanding to verify applicant documents, paired with automated web research that surfaces contextual insights for underwriters deciding whether to approve or deny an insurance claim.
- Built a React-based underwriting workspace where underwriters manage separate projects with multi-document versioning, keeping a human in the loop (HITL) for the final decision.
- Reduced typical case-review time from half a day to **2 days** (longer in complex cases) down to about **~15 minutes**, with edge cases capped at **~1 hour**.

## AI-Assisted Software Engineering

---

- Advanced user of Claude Code and GitHub Copilot for enterprise software development, experienced with Agent Mode, Edit Mode, Planning Mode, and approval-based AI-driven development workflows.
- Integrated reusable Claude Skills and AI Agents into engineering workflows spanning development, documentation, testing, Git operations, commits, and pull requests.
- Selected appropriate AI models based on reasoning complexity, speed, and context requirements; experienced with MCP integrations, AI SDKs, RAG pipelines, and enterprise agent workflows.

## Leadership & Technical Contributions

---

- Led the Next.js architecture migration and established a reusable project structure adopted across teams.
- Conducted internal knowledge-sharing sessions on Next.js, AI SDKs, and AI-assisted development practices.
- Participated in client demos, solution presentations, and architecture discussions.
- Contributed to coding standards, reusable architecture, and developer productivity initiatives.

## Personal Projects

---

### useApiGuard — *Next.js, TypeScript, React*

- Designed and published a reusable React hook that standardizes API communication, centralizing loading states, error handling, request-lifecycle management, and response processing.
- Open-sourced the package with comprehensive documentation and real-world examples, and published it as an NPM package for reuse across multiple React and Next.js projects.

---

### Hospify – Hospital Management System — *Spring Boot, React.js, MySQL*

- Developed a comprehensive hospital management platform with modules for patient registration, doctor management, appointment scheduling with availability management, and administrative workflows.
- Designed medicine management and prescription-tracking modules, built RESTful APIs with Spring Boot, and integrated them with a responsive React.js frontend and relational database schemas.

---

### Task Manager — *Next.js, TypeScript, PostgreSQL*

- Bootstrapped and architected a personal productivity platform for managing learning, projects, certifications, career goals, and daily tasks, with interactive dashboards, progress tracking, activity timelines, and Kanban boards.
- Planned as an open-source, self-hosted productivity platform, with a focus on scalable architecture, reusable components, and extensible design for future community contributions.

## Achievements

---

- Emerging Star Award – Synergech (2025)

## Certifications & Courses

---

- Claude Code in Action – Anthropic
- Building with the Claude API – Anthropic
- Introduction to Model Context Protocol – Anthropic
- Model Context Protocol: Advanced Topics – Anthropic
- Introduction to Agent Skills
- Microsoft Certified: Azure AI Engineer Associate (AI-102) – Preparing
